

AI News Automation System (n8n) – Problem Statement

Problem Statement

Professionals, students, and technology enthusiasts often rely on multiple news websites, blogs, and online sources to stay updated with the latest developments. However, manually visiting different platforms every day, filtering relevant articles, reading lengthy content, and keeping track of important updates is time-consuming and inefficient. As the volume of digital information continues to grow, users face information overload, making it difficult to quickly identify the most important news. There is a need for an automated solution that can collect news from various sources, extract key information, and deliver concise updates directly to users without requiring manual effort.

Proposed Solution

The proposed solution is an AI-powered News Automation System developed using n8n. The workflow automatically fetches the latest news articles from predefined sources through APIs or RSS feeds. The retrieved articles are processed using an AI model to generate concise summaries that capture the key points of each news item. After summarization, the system compiles the most relevant news into a structured email and automatically delivers it to users at scheduled intervals. By combining workflow automation, AI-based text summarization, and email integration, the system reduces manual effort, saves time, and ensures users receive important updates in an easily consumable format.

Objectives

- Automate the collection of news from multiple sources.
- Reduce the time spent searching and reading news articles.
- Generate concise AI-powered summaries of lengthy content.
- Deliver personalized news updates directly through email.
- Improve information accessibility and productivity.
- Demonstrate workflow automation using n8n and AI services.

Expected Outcome

The system will automatically fetch, summarize, and distribute news updates without human intervention. Users will receive timely and concise news summaries through email, enabling them to stay informed while significantly reducing the effort required to monitor multiple news sources.
